Understanding The Results

Dutch Connection

Cultivation Suggestions

Facts

Bloom starts just as the snow disappears
Last for 3 weeks
Individual flowers last 3 to 7 days
Some clones are early, and a few are late
For additional bloom, plant some where the snow is last to leave
6.5-12 cm tall (2½-4½ inches)
4-10 cm in diameter (1½-4 inches) [3.5-8.5 cm tip-to-tip]
Square to octagonal leaves
Leaves grow 45 to 60 cm (18 to 24 inches) after flowers bloom
Some varieties perform well, others don't
Variety with the best scent is Jeannine

Ink spot develops at end of growing season
Pests: slugs [re: flowers], hares (Holland), small animals [re: bulbs]

50,000,000 bulbs are sold annually

Species

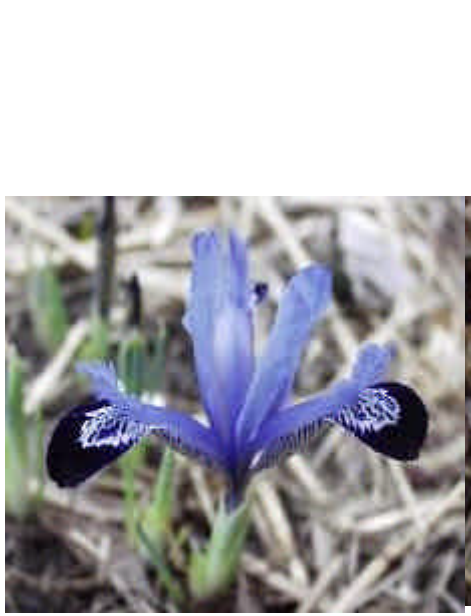
2n = 20	
bakeriana	Blue bicolor with velvety dark blue fall blade, and orange pollen. Leaf cross section is octagonal.
hyrcana	Blue with white pollen
histrio	Pale blue with darker spots and white pollen
reticulata	Variable colour. Wild collected forms have olive, orange, or yellow pollen
pamphylica	Brown and blue with orange pollen. Only crosses with itself
vartanii	Blue, occasionally white, with white pollen. Tender
kolpakowskiana	Blue, purple & white, with white pollen. Distinct from other Retics
winklerii	Blue, purple & white, with white pollen. Description speaks of cherry red
2n = 16	✍ Produce large bulblets
histrioides	Blue with large flower parts and white pollen
winogradowii	Pale yellow with white pollen. (Different chromosomes from *histrioides*)
2n = 18	✍ Produce bulblets
Çat species	Purple with white pollen. Yellow or orange ridge on fall.
danfordiae (diploid)	Lemon yellow flowers with green spots. White pollen. The commercial form is a triploid (3n = 27) and therefore sterile.
sophenensis	Blue with white pollen

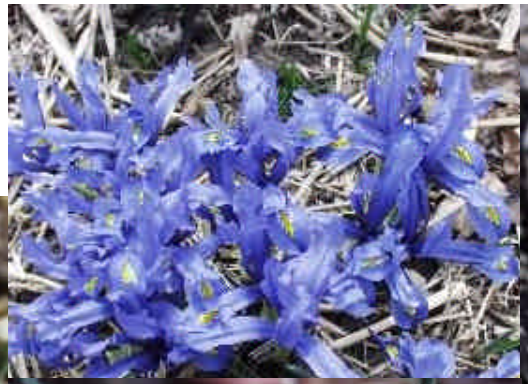
<u>"In The Wild"</u>

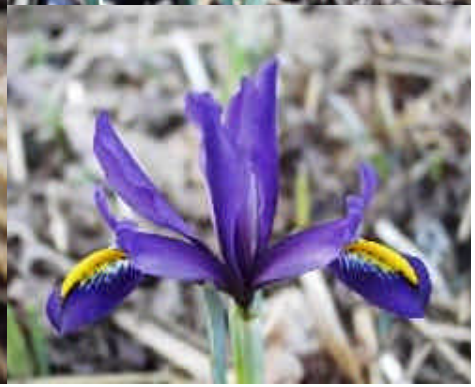
Species 2n = 20

2n = 20

bakeriana	Turkey [and Iran]. Mathew suggests forms in Iran look similar to *reticulata*
hyrcana	Georgia. This may simply be a form of Iris *reticulata*
histrio	Syria. Slightly tender
reticulata	Turkey, Georgia, Iran, Iraq. The forms we know of are only the tip of the iceberg. The richest untapped area is Iran. Not all forms have narrow flower parts.



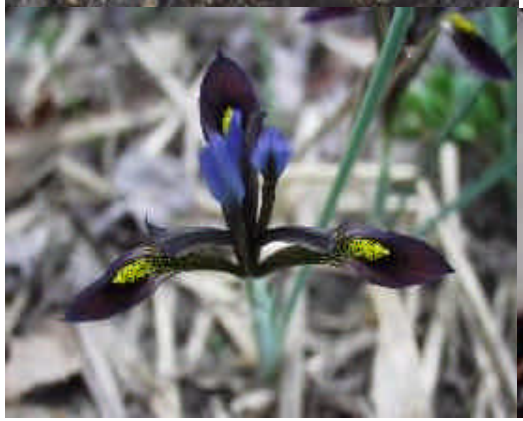


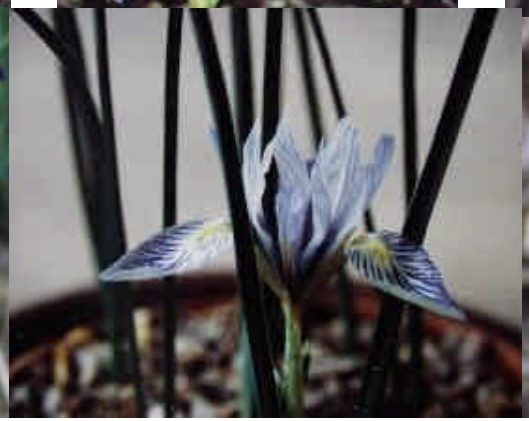


Species - Misc

2n = 20

pamphylica	Turkey. Nice but not showy because of its dark colours and the fact its leaves are well up when it blooms.
vartanii	Israel. No longer grown commercially in Holland.
kolpakowskiana	Central Asia. Foothills of north and western Tien Shan mountains
winklerii	Central Asia. Seems to be quite like *kolpakowskiana*. Still very much a mystery plant. Collected in 1997 by Janis Ruksans & Arnis Seimens.





Species 2n = 16

2n = 16 ✍ Produce large bulblets

histrioides Turkey. Mid season

winogradowii Georgia from Alpine Meadows. Needs a bit of moisture in the summer. Late season

Species 2n = 18

2n = 18 ✍ Produce bulblets

Çat species	Turkey. Small flowers
danfordiae	Turkey. Standards have been reduced to a short bristle. Can have small
(diploid)	flowers. Early season.
sophenensis	Turkey. Mid seasom.

Hybrids Available Commercially

Name	Overall Colour	Registered	By	Pod Parent	Pollen Parent	Sterile Or Fertile	Pollen Colour*
'Alida'	light blue	199?	?	sport of 'Harmony'		sterile	?

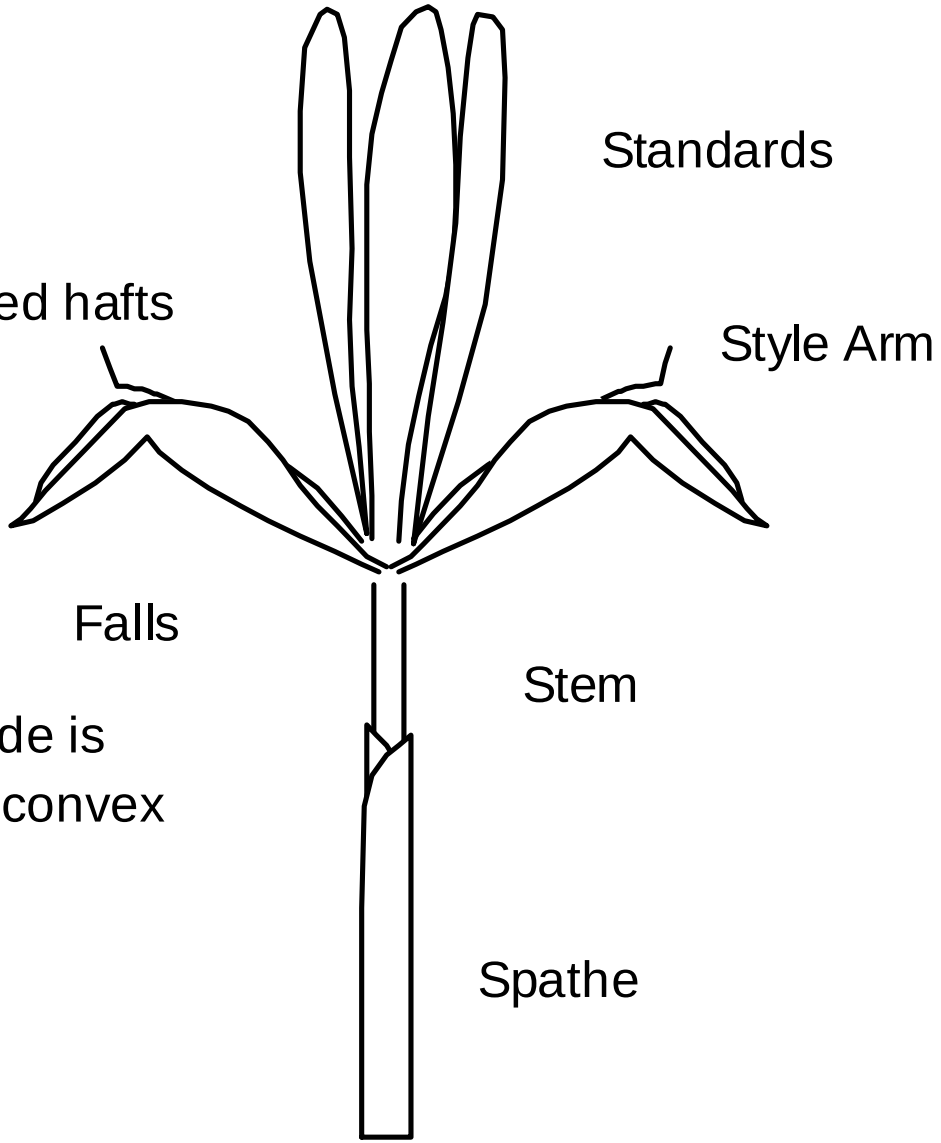
'Katharine Hodgkin'	blue & pale yellow	1960	E.B. Anderson	*histrioides* 'Major'	*winogradowii*	sterile	white
'Marguerita'	blue	199?	?	sport of 'Clairette' with variegated leaves		fertile	?
'Michael'	dark blue	1973	William van Eeden	'Springtime'?	?	fertile	orange
'Natascha'	almost white	1973	William van Eeden	'Cantab'	self	fertile	orange
'Pauline'	wine red	<1953	C.J.H. Hoog	*reticulata*	*bakeriana*	fertile	orange
'Pixie'	dark blue	199?	?	Sport of 'Harmony'		sterile	?
'Purple Gem'	wine red	1952	Van Tubergen	*bakeriana*	?	fertile	orange
'Royal Blue'	blue	<1936	Miss A.L. Hutley	?	?	sterile	yellow
'Springtime'	blue	1950	C.J.H. Hoog	*reticulata*	*bakeriana*	fertile	orange
'Violet Beauty'	violet	<1953	C.J.H. Hoog	*reticulata*	*histrioides* 'Major'	sterile	yellow

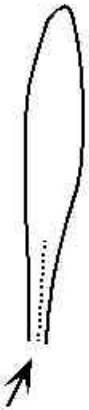
* Pollen colour can be separated into essentially three groups: white, orange/yellow and olive green. There is a clear tendency for parents with white pollen crossed with orange ones to give progeny with somewhat yellow pollen; a diluting effect so-to-speak. Note: some sterile varieties have essentially no pollen (i.e. no complete pollen grains). In these cases the colour is of the pollen grain "garbage".

Profile



Standards
Semi-winged hafts
Style Arm
Ridge
Falls
Stem
Fall blade is
slightly convex
Spathe

Flower Parts

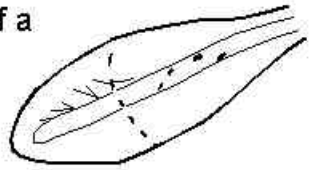


On a few standards there is dull yellow stripe about 12 cells wide

Arch point

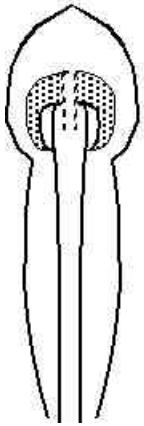
Yellow ridge

Veins of a darker colour



Blotches: some cells at the edge of each blotch are lighter in colour, but to the naked eye they appear solidly coloured, and sharply focused

Top view of a flattened fall



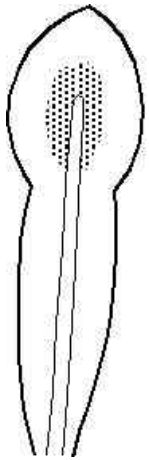
Blue-purple

Physical ridge

Light blue

White

Yellow



Velvety region

Hybridizing Goals

Hardy hybrids that resist disease and strange weather
Consistent bloom year after year
Good increase (for commercial sales)
New colours
New patterns
Tri-colour flowers: standards, styles, and falls all different
Large, showy flowers e.g. wider flower parts
Thick substance to withstand pounding raindrops
Long lasting flowers
Strong stems so flowers don’t fall over in the wind
Flowers that open fully and falls that don’t curl under
Two flowers per bulb in an average garden
Scented flowers: noticeable, but not too strong
New characteristics such as ruffled standards & styles
Variegated leaves

histrioides x *winogradowii*

Katharine Hodgkin

Frank Elder

Sheila Ann Germany

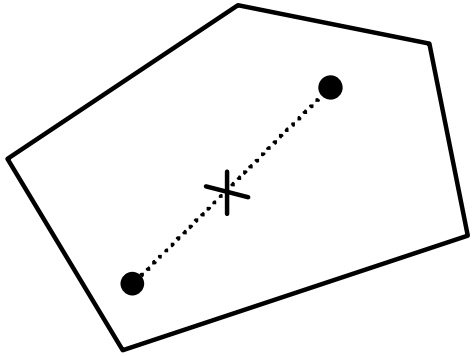
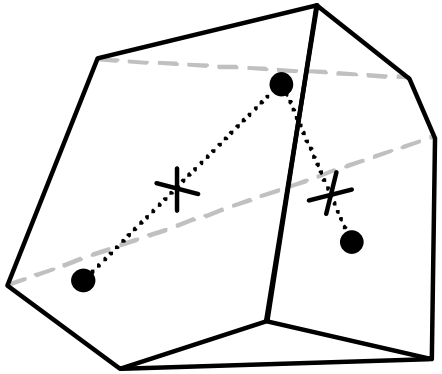
F2 sxd Hybrids - with Çat
- whites

Hybridizing Potential



Two Species



Three Species

Wishful Thinking

'J.S. Dijt' x *danfordiae*
bakeriana x *danfordiae*

winogradowii x *danfordiae*
sophenensis x *danfordiae*

- Wine red crossed with bright yellow
- Possibly greenish stds. with *bakeriana*'s dark velvety blue on the blade of the fall
- Possibly an "improved" yellow
- Possibly bright yellow with blue stripes. Brighter than 'Katharine Hodgkin', and with a different form.

Frank Elder
sterile

96-BN-1 F2 sxd
fertile

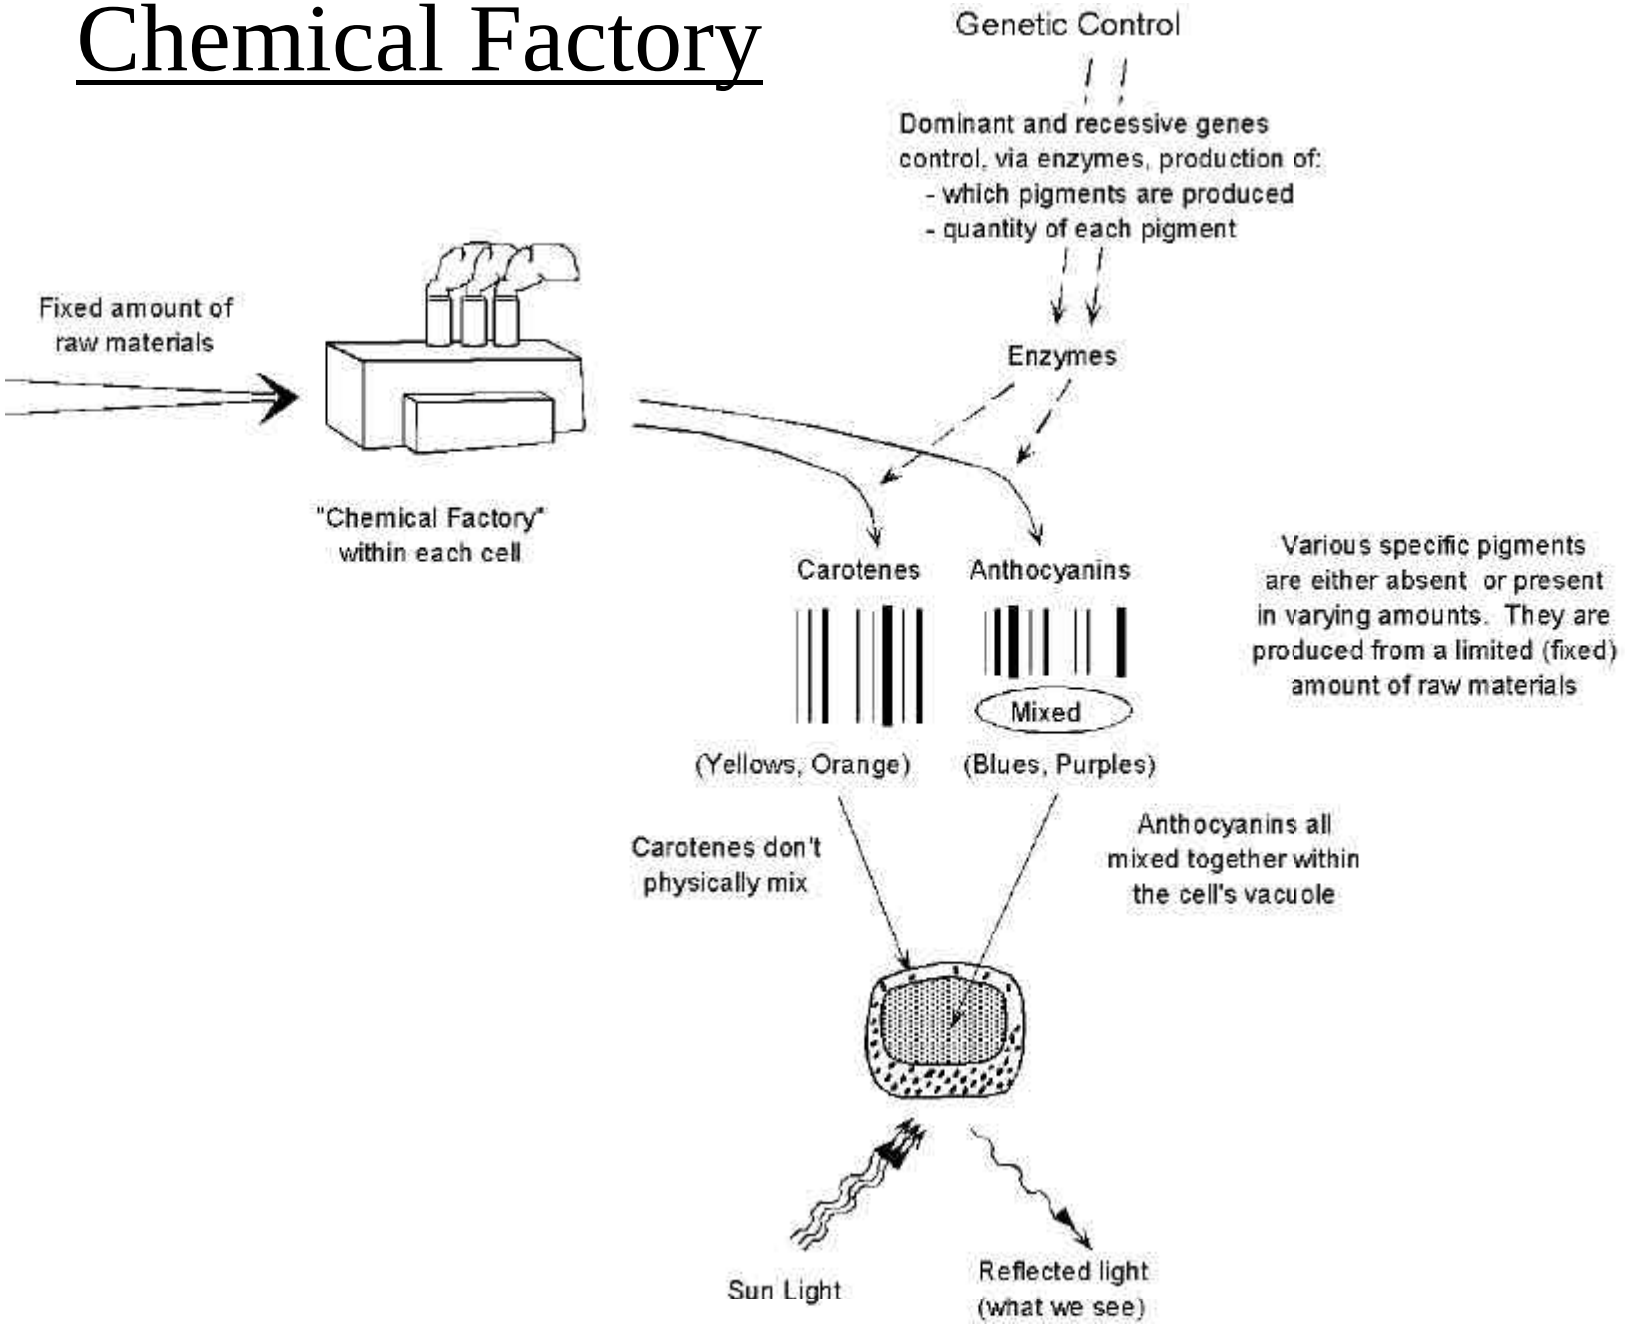
Chemical Factory



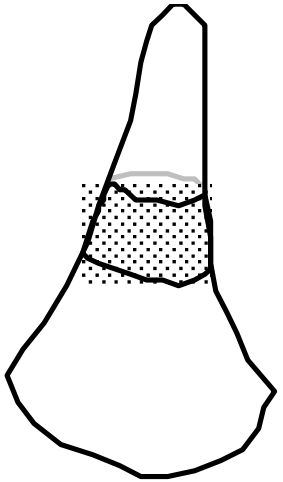
Cell

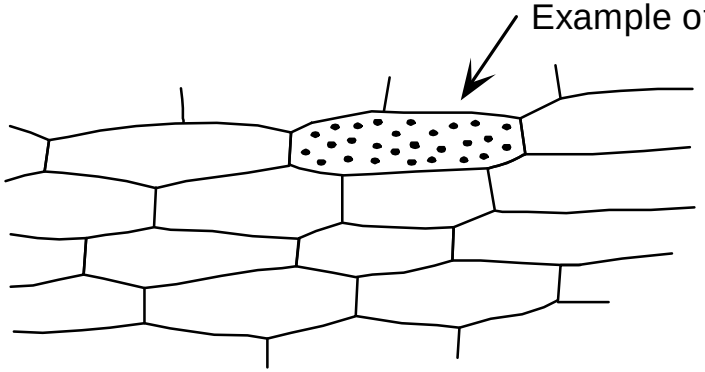
1 2 3

1 - Violet flower

2 - Yellow flower with colourless cell sap and yellow plastids

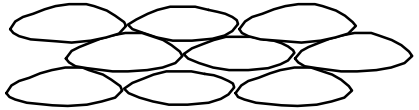
3 - Brown flower with violet coloured cell sap and yellow plastids



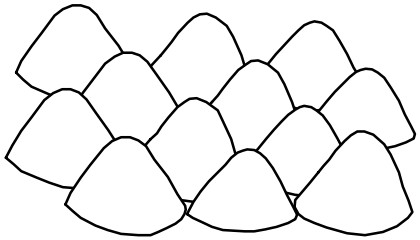


Cells on fall under style arm, as well as cells on the lower centre portion of the standard. One cell is illustrated as having carotenes.

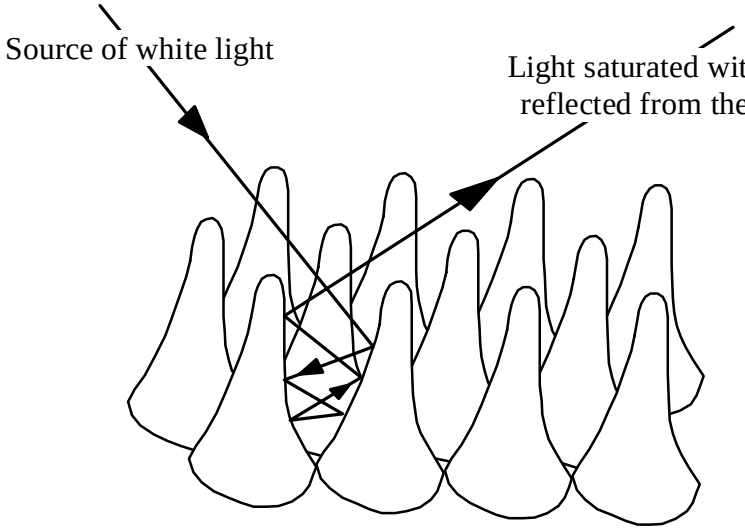
Cell Structure



"Cobblestone"
This is the most common structure. It is found on the back of falls as well as on standards.



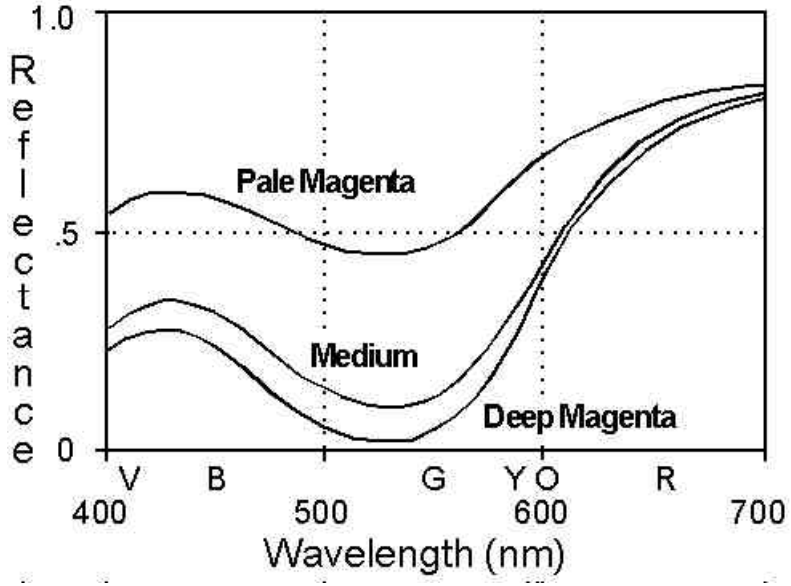
"Hills"
These cells are higher than the "cobblestones." They are found on the front of a fall's blade, and make the colours look more "alive." This "alive" look can be seen by comparing with the back of the blade which has a "cobble stone" surface.

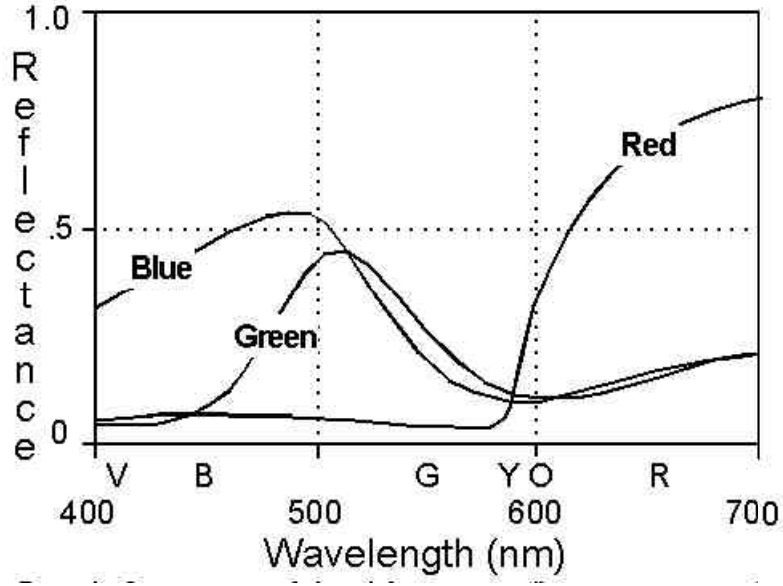


Papilla-shaped cells
They are prevalent on fall blades, particularly on and around the end of the ridge. As a group they give the velvety appearance and texture to varieties like *bakeriana*, 'Violet Beauty,' etc. In these examples the whole blade's surface is made up of papilla-shaped structures. This velvety effect is not really noticeable with light colours.
Papilla-shaped structures are actually multicelled (~up to 3)

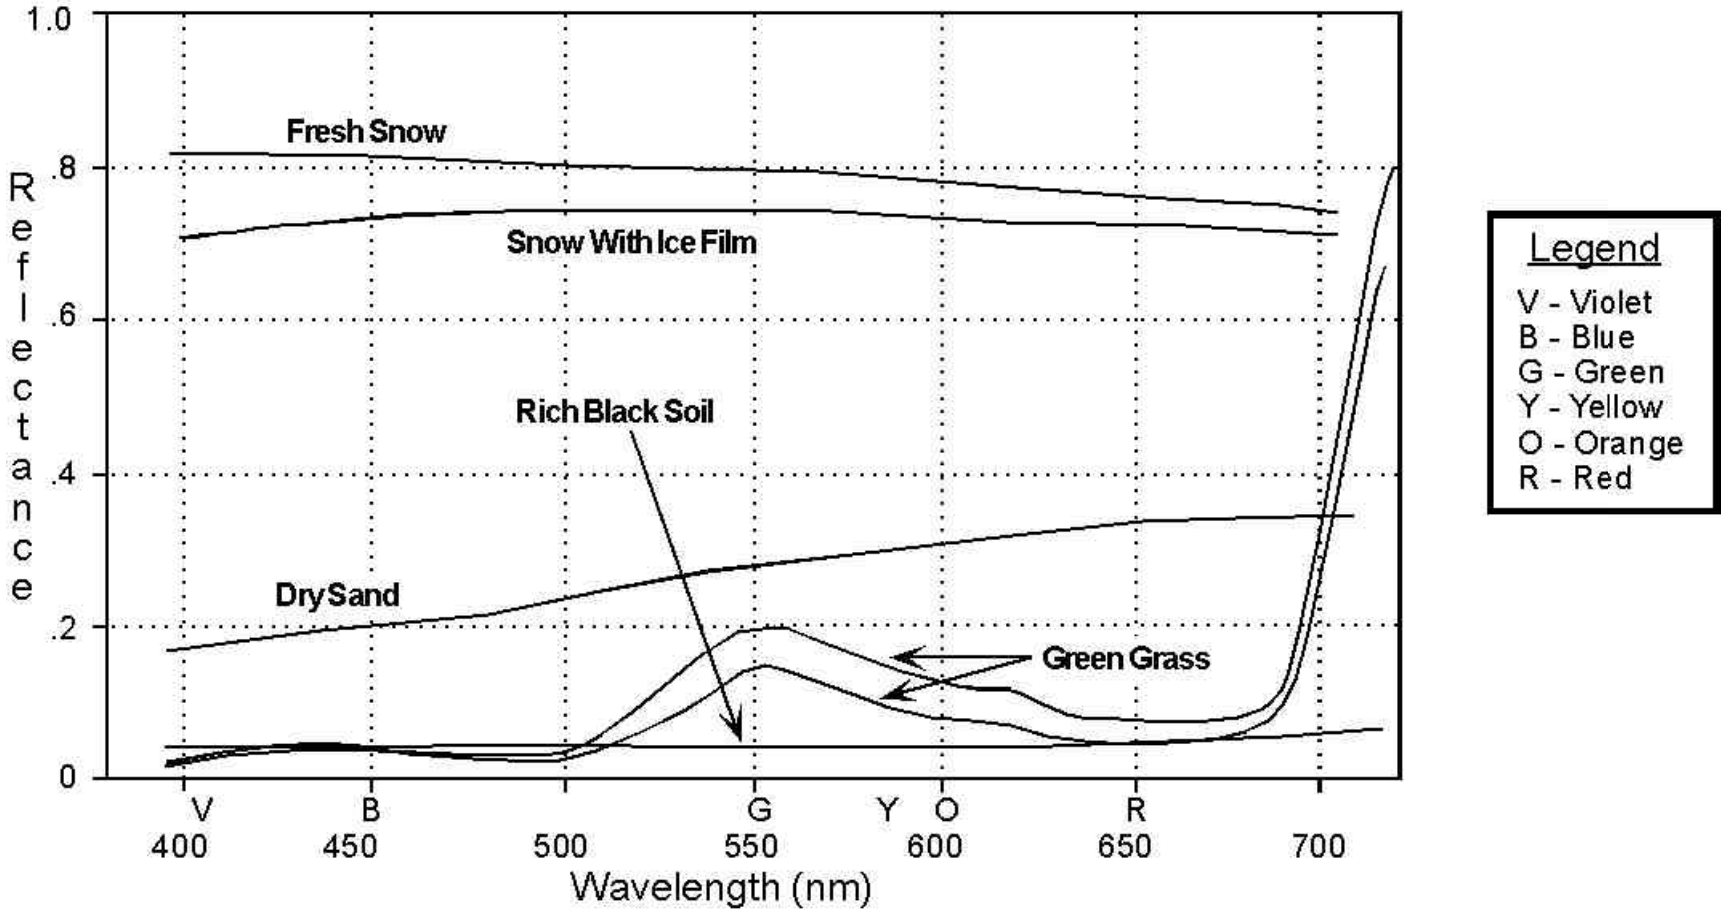
Figure 3 Cell Structures

Reflecting Light

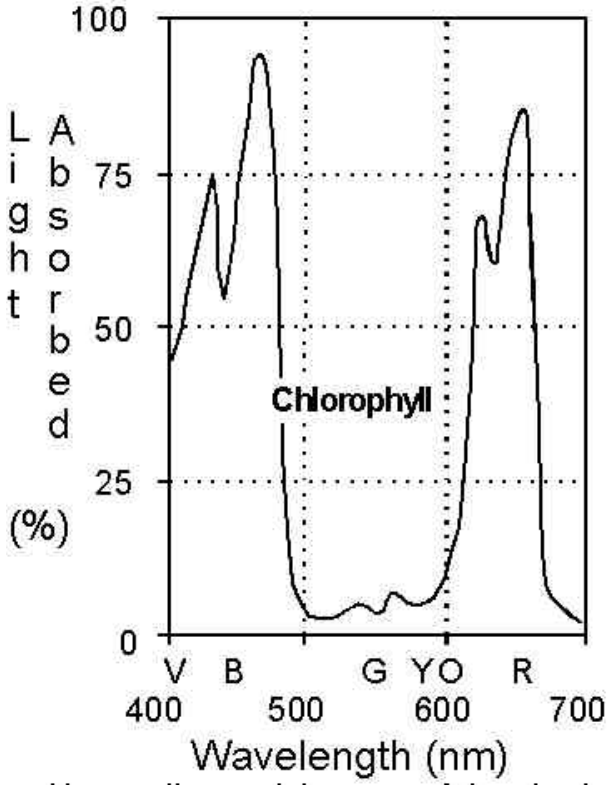


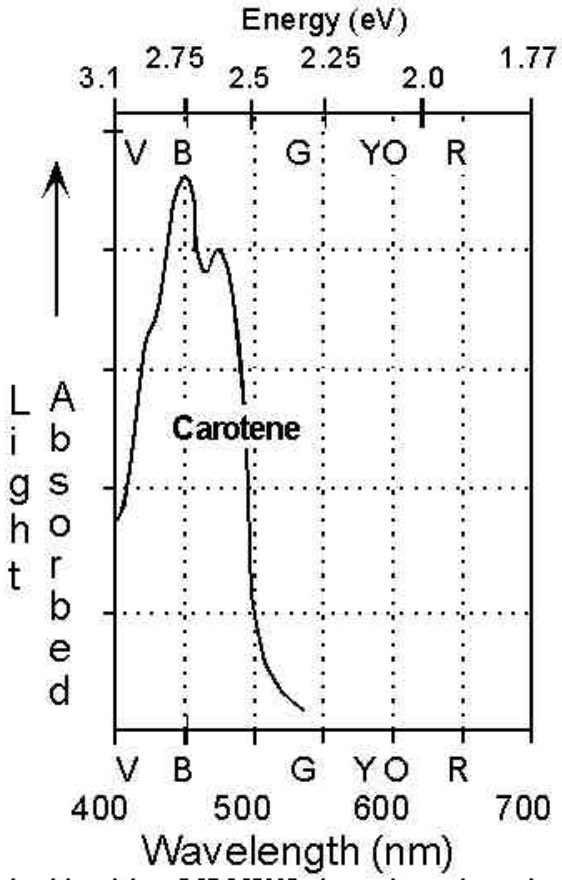


Wavelengths Of Light Making Up The Colours We See

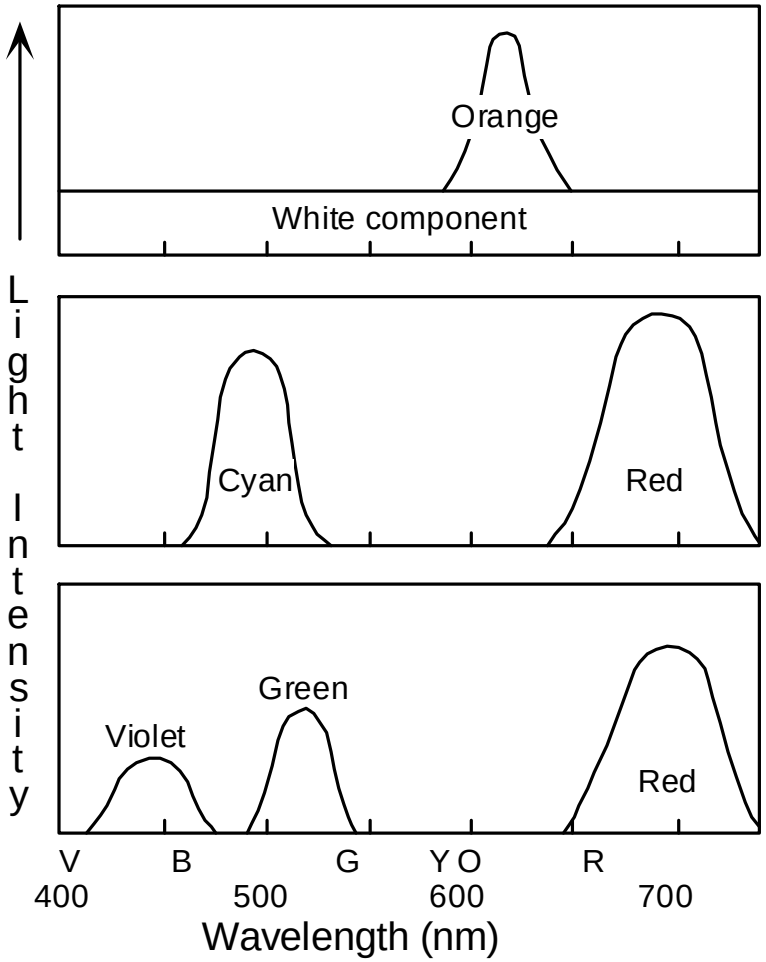


Light Absorption





The Colour Pink



Mix of 25% pure 620 nm orange light with 75% of white light.

Mix of red light and cyan (cyan is a blue-green colour).

Mix of red, green, and a small amount of violet light.

Different ways of obtaining metameric beams of pink light (i.e. to our eye they appear to yield the same pink).

Legend

V - Violet
B - Blue
G - Green
Y - Yellow
O - Orange
R - Red

Second Generation Hybrids Involving *sophenensis*, *danfordiae*, and the Çat Reticulata

	Blue	**White**	**Yellow-Blue**	**"Spotted Light Blue-Green"**	**Yellow**
F1 x F1	20	16	8	0	5
F1 x *danfordiae* involving Çat	3	19	13	6	17
	4	4	6	0	4
Total to-date:	**27**	**39**	**27**	**6**	**26**

To-date many of the yellows have been ***danfordiae***-like. Only this year's 97-CN-2, and 98-MN-1, which I've included in the yellow category, weren't.

Analyzing Yellow

	Blue	White	Yellow-Blue	"Spotted Light Blue-Green"	Yellow

Cultivation Suggestions

? Well-drained soil (e.g. sandy loam / sandy topsoil), with lots of moisture in the early Spring (i.e. snow melt).
? To prevent ink spot soil should be fairly dry around the time the leaves are starting to turn brown.
? Should have at least half a day of sun.

? Replant every two years or so
? Best if it's into a new spot in the garden.
? In Holland they are treated as crops, and only planted in the same area every 10 years.

? Plant several varieties both where snow first melts, and in a shaded area where it's the last to leave.

? Remember, the bulbs need to regenerate, so the last thing you want to do is disturb them while they're in growth.
? Wait until the leaves start to turn brown, then do what you will. Otherwise you're only ruining next year's bloom!

? A little bit of low nitrogen fertilizer at the beginning of the bloom season is good for bulb regeneration.

Milestones

1985/86: successful bulb collecting expeditions to Turkey, in particular to collect a diploid form of Iris *danfordiae*

1990: purchased a larger form of diploid *danfordiae* from Ahmet Atilla in Turkey

1993: first of eventually three hybrids bloom from a 1988 cross (88-AX) of Çat ANM2175 x *danfordiae* ANM2325

1994: sixteen F1 *sophenensis* x *danfordiae* (sxd) hybrids bloom from four crosses made in 1989

1997: first Dutch bulb grower begins testing my hybrids

1999: first F2 sxd bloom: the remarkable Starlight (94-HW-1)

2000: two more Dutch bulb growers begin testing

2002: a 4th Dutch tester starts; now have access to a lab in Holland

2003: Wim de Goede declares there are 4 Reticulata clones he wants to go through with; a 5th grower added (mainly interested in Junos)

In Summary

I have opened up a whole new world for Reticulata Irises.

1) used clones from the wild to bring in additional characteristics
2) discovered *sophenensis* & *danfordiae* are fertile
3) plus, brought Çat into the mix

The words “success is a combination of good luck, knowing what you’re doing, and a lot of hard work,” are just as true today as they were when I wrote them in 2000.
